Time	On screen	Narration
0:00 to 0:20	Title card: **PaidUp** and the pitch line. Your face on camera is optional.	*“Hi, I'm Rohit Shukla. If you freelance, you know the job doesn't end when the work does. There's still an invoice to write, send, and chase, and nobody pays you for that part. PaidUp does it for you in PayPal, and it never sends anything until you say yes.”*
0:20 to 0:30	The PaidUp app, already logged in.	*“Let me show you. This is the live app, running on the PayPal sandbox, PayPal's test environment. Every invoice you'll see is a real invoice there.”*
0:30 to 1:00	Type the John message. The card appears. Point at the client, items, total, and due date. Click **Approve**. The payer link appears.	*“Say I just finished a landing page for John. I type it the way I'd say it. Gemini turns that one sentence into an invoice, but look: nothing has gone out. It can only propose this card, and the server has already checked the amount, the currency, and the due date. It goes out only when I click Approve. And there it is: a real invoice in the PayPal sandbox, with a payment link.”*
1:00 to 1:30	Open the payment page. Log in as the sandbox buyer and pay. Cut the waiting. Back in PaidUp, wait for the row to turn **PAID** by itself. Don't click Refresh on camera.	*“Now let's switch sides. I'm John, and I pay with a sandbox account. Watch the dashboard. As soon as the payment goes through, PayPal tells PaidUp, PaidUp checks that the message really came from PayPal, and the invoice turns paid on its own. No refreshing, no spreadsheet.”*
1:30 to 2:00	Attach **06-handwritten-quote.png**. Show the photo for one second. The card appears. Click **Approve**. The new invoice appears as SENT.	*“Not every job starts as a neat sentence. Sometimes it's a quote written on paper. I take a photo, and Gemini reads the client, the items, and the prices into the same card, with the same checks. One click, and that invoice is out too.”*
2:00 to 2:20	Type **Who owes me money?** The answer names Maria Lopez and 1,580.00 USD.	*“And when you want to know who still has to pay, ask. The answer comes from your real PayPal invoices, not from the AI's memory. John paid, so only Maria is on the list.”*
2:20 to 2:40	The architecture diagram: **scripts/architecture.png**.	*“PaidUp is a Go server that uses Gemini function calling and the PayPal Invoicing and Webhooks APIs. Every hour, it also looks for overdue invoices and drafts a polite reminder for you. That reminder waits for your approval too.”*
2:40 to 2:50	Title card with the repository link.	*“PaidUp. The AI does the paperwork, and you keep the final click. Thanks for watching.”*
